DETAILED ACTION

1. Claims 1-29 are presented for examination. Claims 1, 7, 16, and 24 have been amended.

Claim Rejections - 35 USC § 112

2. Rejections withdrawn due to the amendment.

Claim Rejections - 35 USC § 102

3. Rejections withdrawn due to the amendment.

Allowable Subject Matter

4. Claims 1-29 are allowed.

The following is an examiner's statement of reasons for allowance:

While Cheong teaches test data of a current test process to improve efficiency of a current process.

And, Puel teaches a prediction methodology to predict values of diverse physical quantities which enter into the running of the manufacturing processes.

And, Good teaches a database server that stores data related to the status of the entities in the current process flow, pre and post process measurement data, state data and priority data.

And, Himmelstein teaches a product control system wherein statistical determinations are continuously made on the basis of current manufacturing process data.

And, Meriam-Webster's Collegiate Dictionary teaches a database is a collection of data organized especially for search and retrieval by a computer.

None of these references, taken either alone or in obvious combination disclose a system, method, or program product having all the claimed features of applicant's instant invention, specifically including: a historical database and filtering the historical database.

Also, there is no motivation to combine these references to meet these limitations. It is for these reasons that applicant's invention defines over the prior art of record.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

5. The prior art or art made of record and not relied upon is considered pertinent to applicant's disclosure.

The following patents or publications are cited to further show the state of the art with respect to filtering a historical database into a list of records with imagery and characterization data, calculating a similarity metric for the images, and determining if the metric falls within the range of [0,1], without processing a workpiece in response to the determination step and without repeating the calculation and determination steps for new records if a metric does not fall within the range of [0,1].
